What is representation?

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

All of Mathematics is some kind of representation theory.

— I. M. Gelfand¹

- a representation \approx a linear space being acted
- a group representation \approx a linear space with symmetry

¹A common misunderstanding is that Gelfand referred the representation to the Gelfand representation in functional analysis. But Gelfand is also an algebraist, for example he is one of the G in BGG theory. 

Why representation?

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

- Some structure which is not easy to be understood
 \rightsquigarrow find a linear point of view
- Some structure which can be understood
 \rightsquigarrow how it acts?
- Example: \mathfrak{S}_n acts on $V \otimes \cdots \otimes V$ by permuting indices.

The purpose of representation

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

- the classification

some classification theory

- How to put the spaces familiar to us into this theory?
- How our classification theory reflects the operators on spaces?
- Example: $GL(V)$ acts on $V \otimes \cdots \otimes V$ by diagonal action.

Why linearity?

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

- There is a number of theory which is specific for linear algebra
 - the dimension
 - the eigenvalue
 - the trace and the norm (determinant)
 - the quadratic form
 - ...
- There is a lot of linear spaces being acted.

Simple modules

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is repre-
sentation?

What is
semisimple

Associative
algebras

References

Thanks

- For a nonzero module M , if the only submodule is 0 and itself, then it is called **simple** or **irreducible**.
- Note that simple modules are all of the form R/M for some left maximal ideal so it is cyclic.

Theorem (Schur)

$\text{End}(M)$ is a division ring.

- Furthermore, if M is “small” and $\mathbb{C} \subseteq \text{End}(M)$, (for example the ring is a \mathbb{C} -algebra), then $\mathbb{C} = \text{End}(M)$.
- This makes M a linear space which is easier to be understood.

Simple modules makes up modules

Lecture 1 —

of algebras
and groups (I)

Xiong Rui

What is repre-
sentation?

What is
semisimple

Associative
algebras

References

Thanks

- If a module M is Noetherian and artinian (finite-dimensional linear space), then there is a filtration

$$0 = M_0 \subseteq M_1 \subseteq \cdots \subseteq M_{n-1} \subseteq M_n = M$$

such that M_{i+1}/M_i is simple.

Theorem (Jordan–Hölder)

The simple modules are unique with multiplicity.

But we lose some information

- Naïvely, do we have

small modules $\overset{1:1}{\longleftrightarrow}$ multiple-sets of simple modules?

- No, compare

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \mathbb{C}v & \longrightarrow & \mathbb{C}v \oplus \mathbb{C}w & \longrightarrow & \mathbb{C}w & \longrightarrow & 0 \\ & & \parallel & & \downarrow \begin{pmatrix} 1 & 1 \\ & 1 \end{pmatrix} & & \parallel & & \\ 0 & \longrightarrow & \mathbb{C}v & \longrightarrow & \mathbb{C}v \oplus \mathbb{C}w & \longrightarrow & \mathbb{C}w & \longrightarrow & 0 \end{array}$$

What is semisimple?

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is repre-
sentation?

What is
semisimple

Associative
algebras

References

Thanks

- We call a module is **semisimple**, if it is a direct sum of simple modules.
- Our dream — it is one to one, that is,

all “small” modules are semisimple

\approx for all $B \subseteq A$, we have $A = A/B \oplus B$.

\approx all short exact sequences split.

- We will call a ring **semisimple** if it satisfies our dream. (to be defined exactly later)
- We will call a lie algebra **reductive** if it satisfies our dream. (to be defined exactly later)

A philosophy

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

- To realize our dream, in philosophy,

semisimple or reductive \approx no morphism like $\begin{pmatrix} a & 1 \\ & a \end{pmatrix}$.

- In principle,

$\begin{pmatrix} a & 1 \\ & a \end{pmatrix}$ in algebra $\approx \begin{pmatrix} a & 1 \\ & a \end{pmatrix}$ appears in representations.

- So, the philosophy is

semisimple or reductive \approx no nilpotent stuff

Definitions

Lecture 1 —

- An **associative algebra** R over a field k , or just **k -algebra**, is a ring with

$$k \subseteq Z(R) \subseteq_{\text{centre}} R \ni 1.$$

We will assume all the k -algebras mentioned are finite-dimensional.

- We will call a k -algebra which is a division ring a division algebra over k .

Semisimple algebras

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

- For an ideal $I \subseteq R$, we say it is **nilpotent** if $I^n = 0$ for some n .

Theorem

Let R be a k -algebra.

*R is semisimple
by our philosophy.
There is no nonzero
nilpotent ideal.*

*R is semisimple
by our dream.
All R -modules are
semisimple.*

Matrix algebra

Lecture 1 —

and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

Let D be a k -division algebra. For integer $n > 0$, define the matrix algebra $R = \mathbb{M}_n(D)$ by usual product.

- It is simple (no nonzero ideal).
- It is semisimple.
- The only simple R -module is D^n .

Wedderburn–Artin theorem

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

Theorem (Wedderburn–Artin)

Each semisimple k -algebra R is a finite direct product of matrix algebras over some k -division rings.

- If k is algebraic closed, then the only k -division ring ($\dim < \infty$) is itself. So just a product of $\mathbb{M}_n(k)$.

The proof of Wedderburn–Artin theorem

Lecture 1 —

- Decompose R itself, as left R -module (so-called regular module), into simple modules,

$$R = {}_{\text{reg}}R = n_1 M_1 \oplus \cdots \oplus n_k M_k$$

with M_i list of pairwise non-isomorphic simple modules, and nM stands for n copies of module M , i.e. M^n .

- Then

$$\begin{aligned} R &\cong \text{End}_R(R)^{\text{op}} & r &\mapsto [s \mapsto sr] \\ &= \text{End}_R\left(\bigoplus_{i=1}^k n_i M_i\right)^{\text{op}} \\ &= \prod_{i=1}^k \text{End}_R(n_i M_i)^{\text{op}} & \text{Hom}_R(M_i, M_{j \neq i}) &= 0 \\ &= \prod_{i=1}^k M_{n_i}(\text{End}_R(M_i))^{\text{op}}. \end{aligned}$$

Summary

■ So we have

R is semisimple
by our philosophy.
There is no nonzero nilpotent ideal.

R is semisimple
by our dream.
All R -modules are semisimple.

R is semisimple
as an algebra.
It is a direct product of simple algebras.

Morita equivalence

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

- For two rings, if the category of finitely generated modules over them are equivalent as abelian categories, then two rings are called **Morita equivalent**.
- For a k -division ring D , there is a Morita equivalence to $\mathbb{M}_n(D)$

$$\left\{ \begin{array}{l} \text{finite dimensional } D\text{-} \\ \text{linear spaces} \end{array} \right\} \cong \left\{ \begin{array}{l} \text{finite dimensional} \\ \mathbb{M}_n(D)\text{-modules} \end{array} \right\}.$$

- Actually, the one dimensional space corresponds to the only simple module.

Classification of division algebras

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is representation?

What is semisimple

Associative algebras

References

Thanks

- By the Wedderburn–Artin theorem,

classification of division algebras = classification of simple algebras

- For algebraic closed field, only division algebra is itself.
- For \mathbb{R} , it is well-known that the only division algebra is \mathbb{R} , \mathbb{C} and \mathbb{H} . (Frobenius theorem)
- For finite field, it is well-known that only finite division ring is a field. (Wedderburn theorem)

Central simple algebras

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is repre-
sentation?

What is
semisimple

Associative
algebras

References

Thanks

- An algebra R over field k is called **central** if its centre $Z(R) = k$.
- By the Wedderburn–Artin theorem, for an k -simple algebra R

$$k \xrightarrow{\text{field extension}} \subseteq Z(R) \xrightarrow{\text{central division ring}} \subseteq D \xrightarrow{\text{matrix algebra}} \subseteq \mathbb{M}_n(D).$$

- Let D be a central division algebra over k ,

$$k \subseteq \underbrace{L}_{\text{maximal subfield}} \subseteq D, \quad [L : K] = [D : L].$$

All such L splits D , i.e.

$$D \otimes_k L = \mathbb{M}_n(L), \quad n = [L : K] = [D : L].$$

Central simple algebras

Lecture 1 —
The structures
of algebras
and groups (I)

Xiong Rui

What is repre-
sentation?

What is
semisimple

Associative
algebras

References

Thanks

- For a field extension K/k ,

(semi-)simple k -algebra $\xrightarrow{-\otimes_k K}$ may not still be (semi-)simple.

(semi-)simple algebra $\xrightarrow{-\otimes^{\text{simple}}}$ may not still be (semi-)simple.

- But central simple algebra acts well

central simple k -algebra $\xrightarrow{-\otimes_k K}$ central simple K -algebra.

(central) simple $\xrightarrow{-\otimes^{\text{central simple}}}$ (central) simple

These are also “if and only if” theorems.

Brauer group

Lecture 1 —

of algebras
and groups (I)

Xiong Rui

What is repre-
sentation?

What is
semisimple

Associative
algebras

References

Thanks

- Define the **Brauer group**

$$\text{Br}(k) = \bigoplus \mathbb{Z} \left[\begin{array}{l} \text{all central simple} \\ \text{algebras over } k \end{array} \right] / \dots$$

where the relation is generated by

- $A = B$ if there is integer m, n such that $\mathbb{M}_m(A) = \mathbb{M}_n(B)$
(i.e. the corresponding division rings are isomorphic);
 - $A = B + C$ if $A = B \otimes_k C$.
- The Brauer group can be also explained as Galois cohomology

$$\text{Br}(k) = \varinjlim_{\text{finite Galois extension } K/k} H^2(\text{Gal}(K/k), K^\times).$$

Summary

Lecture 1 —
The structures
of algebras
and groups (I)

- For general field k ,

simple k -algebras = matrix algebras over $\underbrace{k\text{-division ring } D}$.

$$k\text{-division ring } D = \bigcup_{K/k} \underbrace{K\text{-central division ring } D}.$$

K -central division ring $D \xrightarrow{\text{classified by}} \text{Br}(K)$.

- In particular, for algebraic closed field k ,

simple k -algebras = matrix algebras over k .
